FM DEMO – PEAK CERTIFICATION(DB)

Presented by Abdul Ashwood

10/27/2027

OBJECTIVE & SCOPE

- Goal: validate DB health under 3× load.
- Forecasted peak volume table:

OPU 8.9M units/day (26.8M @3×),
SFS 5.9M units/day (17.6M @3×);
TPS OPU 130.6 / SFS 152.9

Postgres Team Review (External DB Certification)

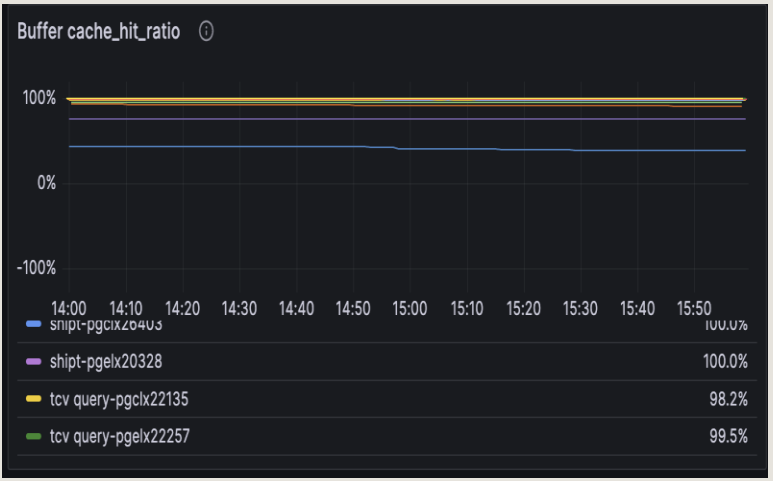

DB instance	Compute	Utilization
fmcoreopu	12 CPU / 32 GB	<5%
opu-query	12 CPU / 32 GB	<4%
SFS-command	8 CPU / 32 GB	<4%
SFS-query	8 CPU / 32 GB	<3%
Order Update Muxer	4 CPU / 16 GB	<6%

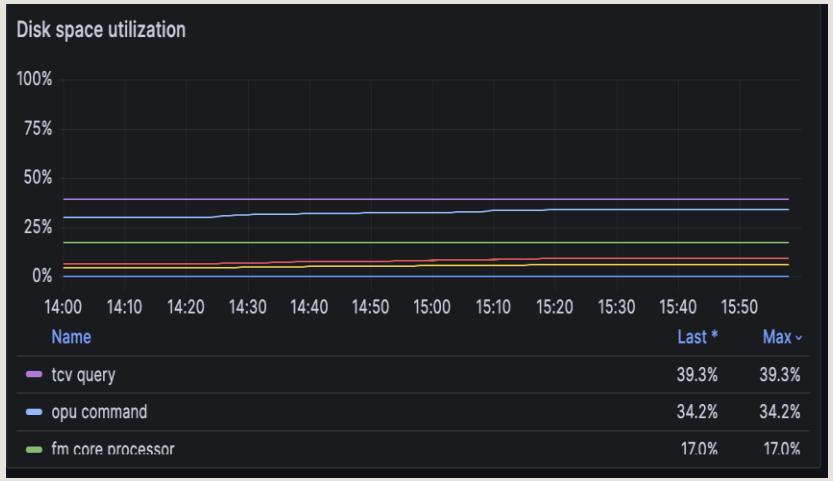

Postgres team reviewed FM DB prior to peak — No major issues

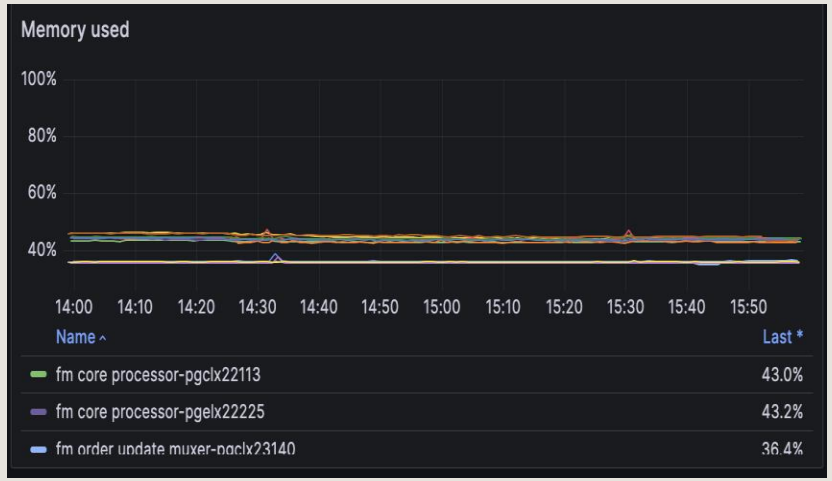

Watch items (low risk):

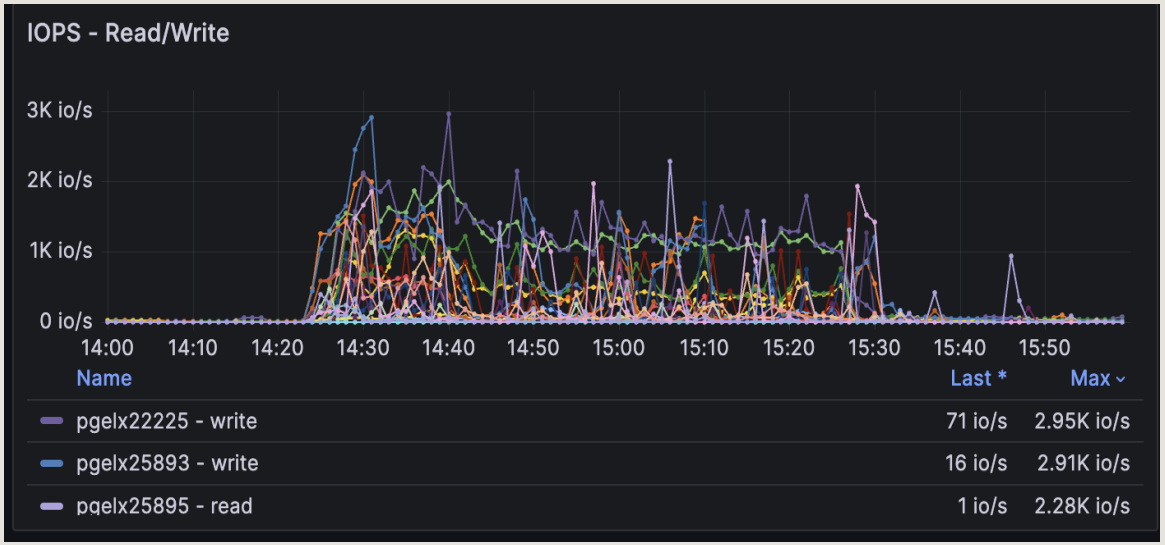

- **CPU steal at peak** — shared-tenant contention could cause brief degradation; pull in the Postgres team if it appears.

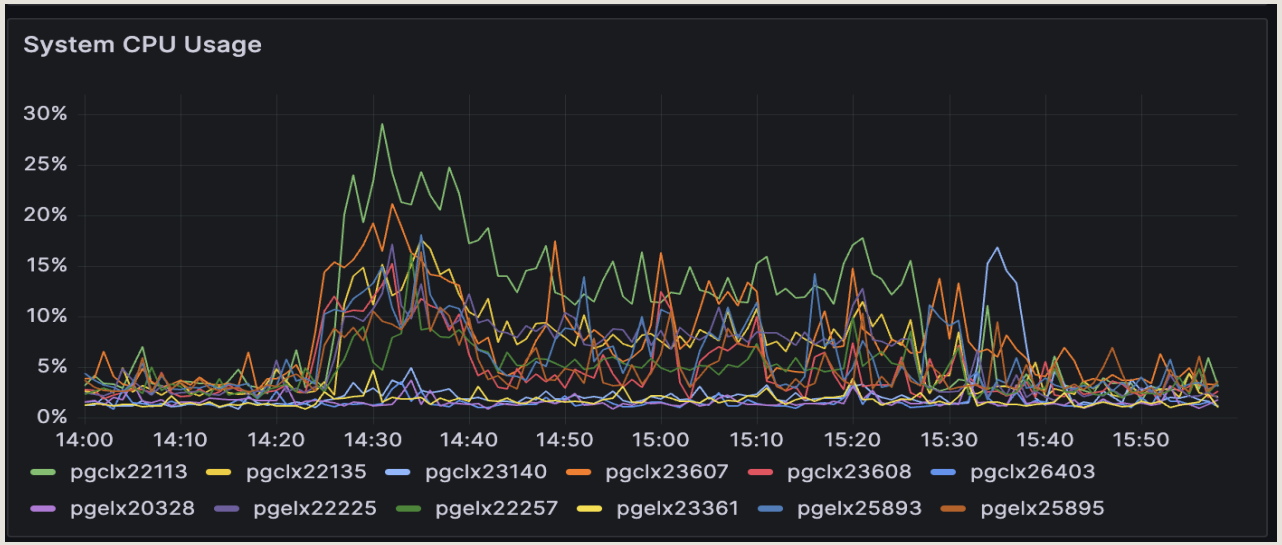

LOAD TEST RESULTS

FINDINGS, LEVERS & CERTIFICATION

CPU —

User and system CPU remained within target with low I/O wait, confirming the database was neither CPU nor I/O bound at peak.

Cache / buffer —

Buffer cache hit ratio stayed high, minimizing physical reads.

IOPS / disk —

IOPS and disk space stayed within provisioned limits throughout the run.

Latency / WAL lag —

VM latency and WAL replication lag remained bounded under sustained peak.

Q&A

THANK YOU
